**Laboratory evaluation of combined effect of jute fibres  
and rejuvenators on some performance characteristics  
of bitumen mixture containing reclaimed asphalt**

*Peter Gallo, Majda Belhaj and Jan Valentin*

- Introduction to the fibres in bitumen mixtures
- Jute fibres
- Rejuvenators
- ACP 16+ 30% RA with reju and/or jute fibres
- Conclusion

PETER GALLO  
FCE CTU in Prague, Czech republic

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

Fibres can have:

- **Stabilizing effect**

- **Reinforcing effect**

## Jute fibres

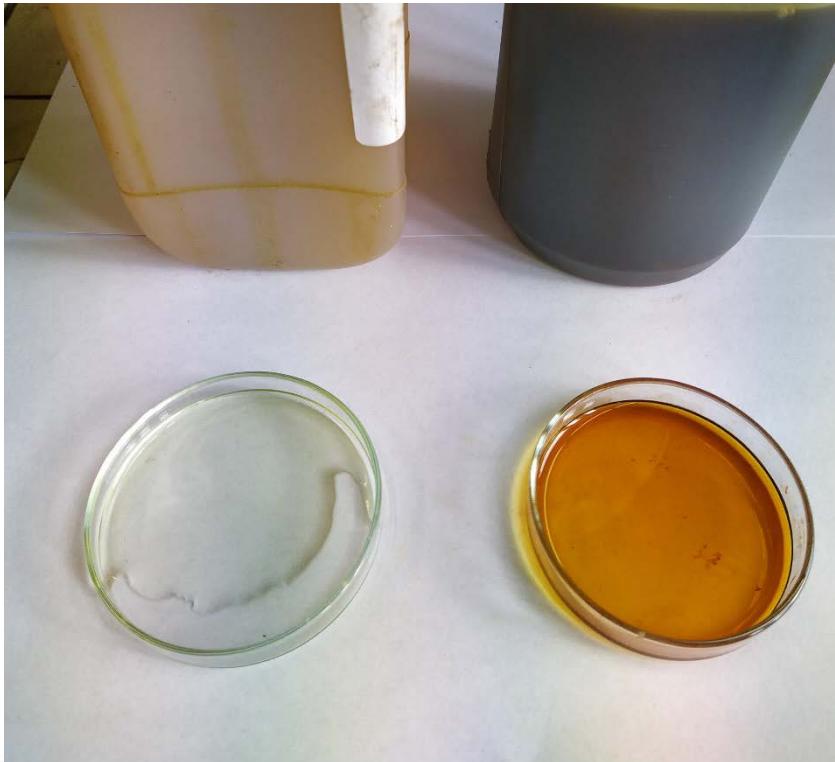

- Plant-based (*Cochchorus*)

Tensile strength (yarn, 10 mm/min):

- Virgin  $\approx 250$  MPa
- 2 h.  $150^{\circ}\text{C}$   $\approx 150$  Mpa
- Stabilizing and reinforcing effect
- Biodegradable
- From a renewable, sustainable source

## Rejuvenators

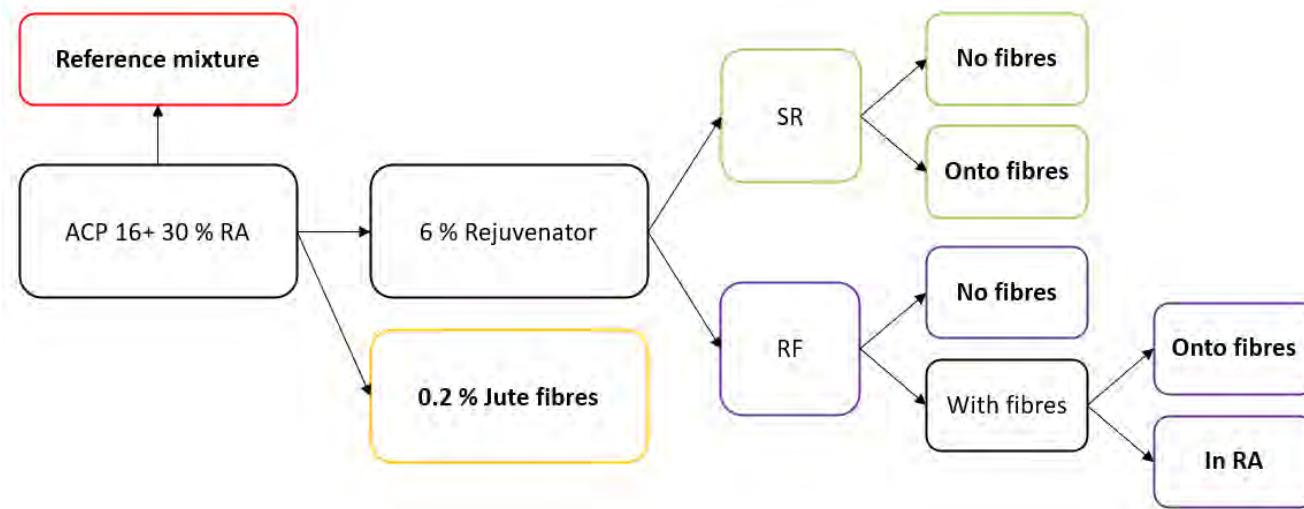

Two commercialized bio-based rejuvenators:

- “SR” (crude tall oil and crude turpentine oil derived additive)
- “RF” (vegetable oil-based additive)

Dosage: by 6 % by mass of the aged binder contained by the reclaimed asphalt.

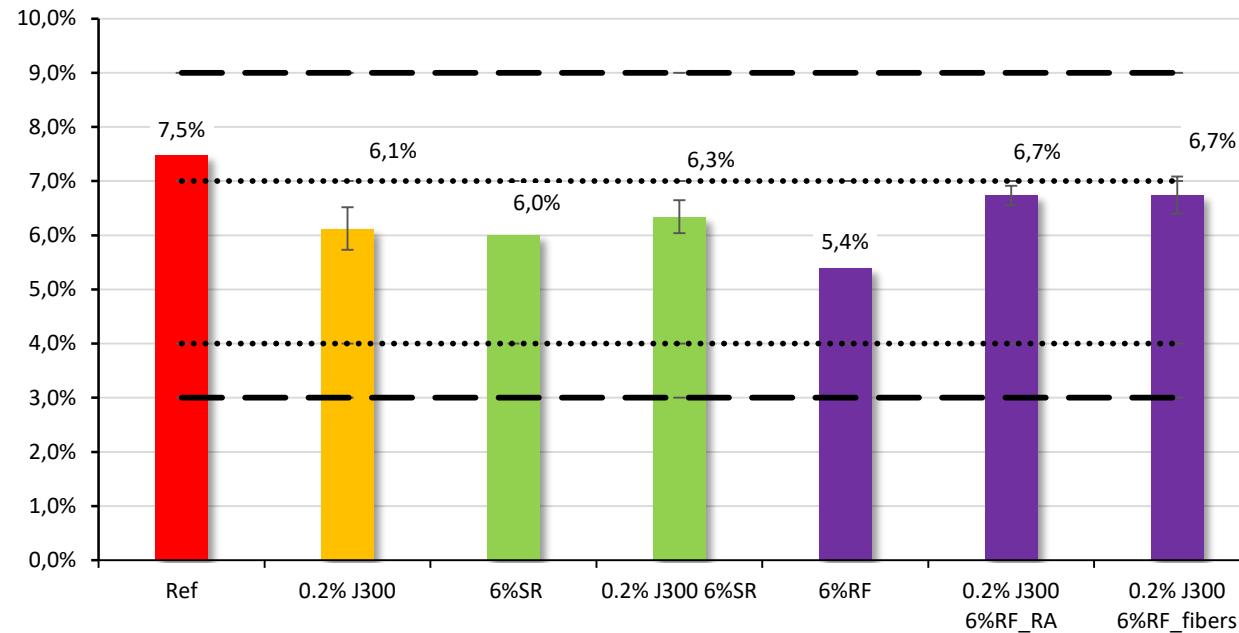

## ACP 16+ 30% RA

- Standard binder 50/70
- Rejuvenator to the pre-heated RA
- Rejuvenator onto fibres

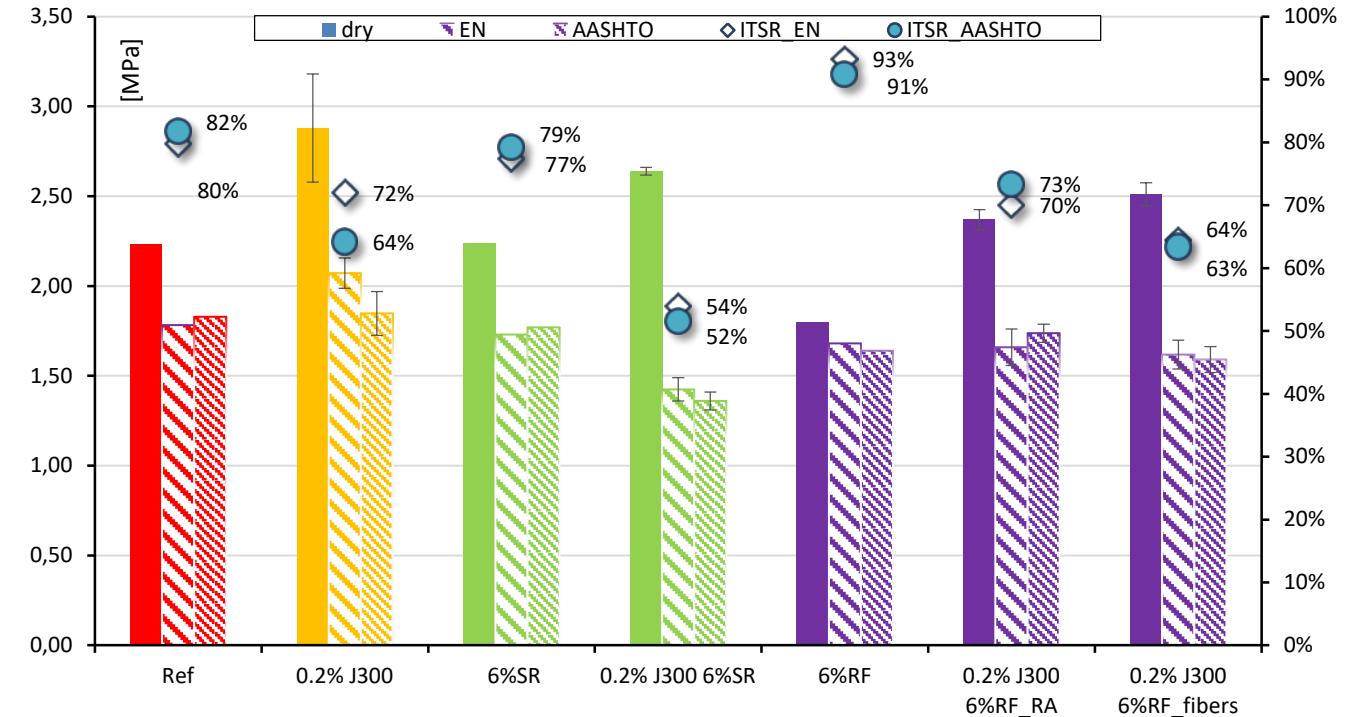

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## ACP 16+ 30% RA – Air voids

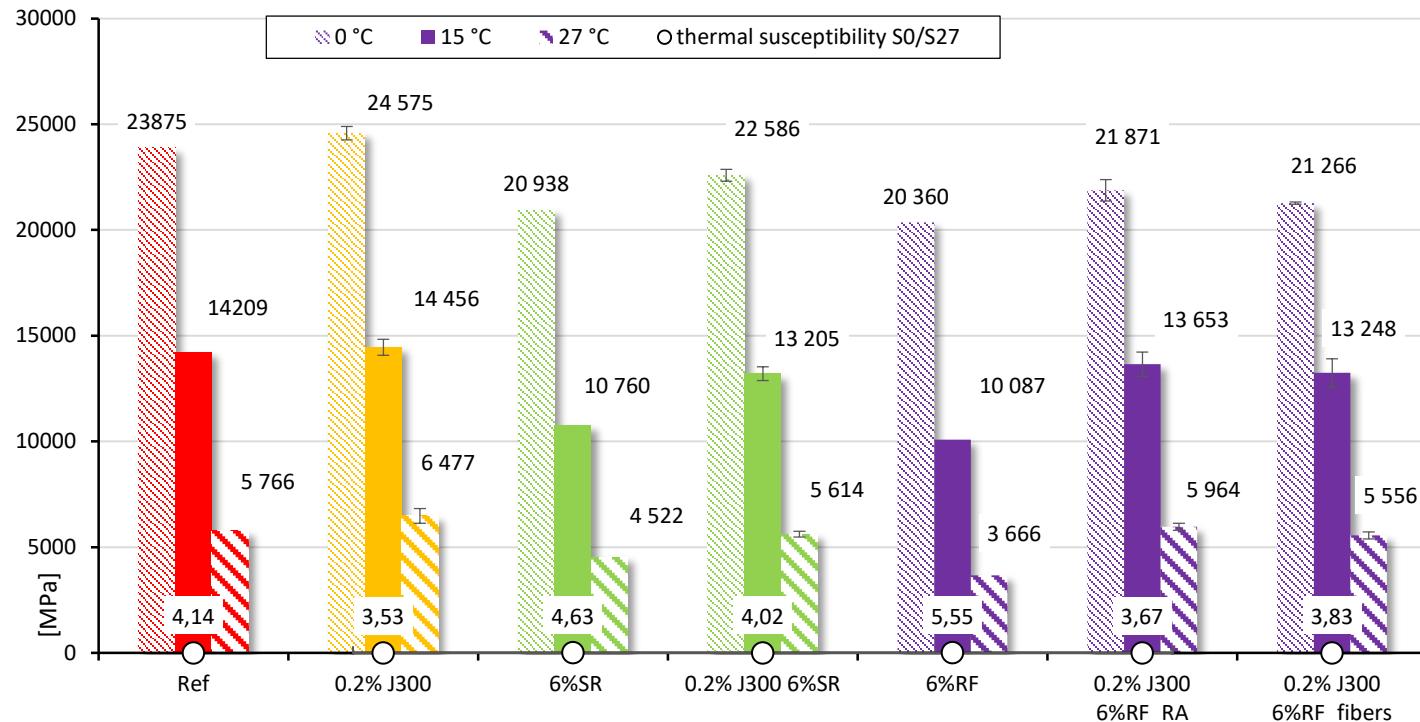

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## ACP 16+ 30% RA – Moisture and freeze-thaw susceptibility

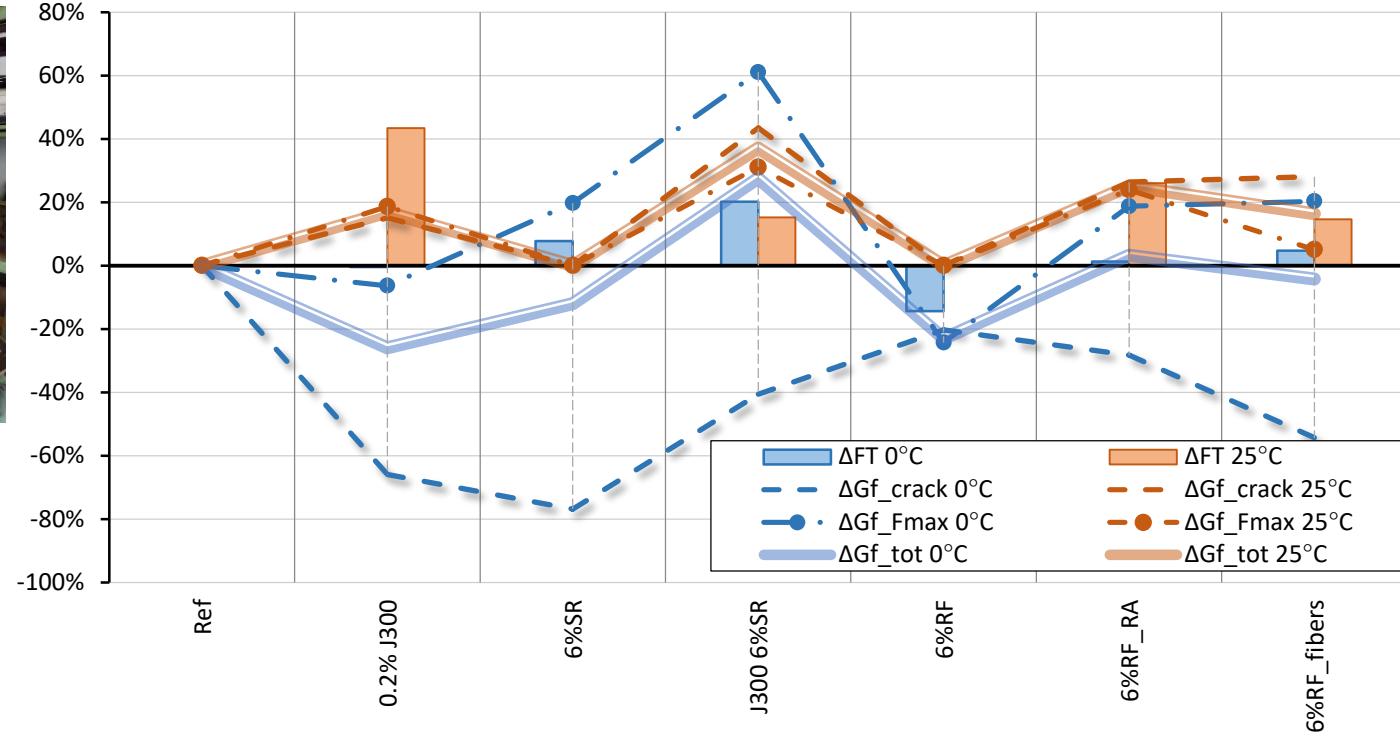

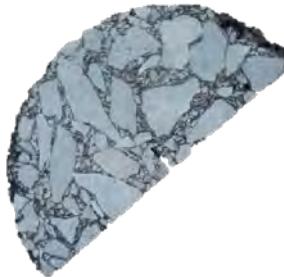

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## ACP 16+ 30% RA – Stiffness – IT-CY

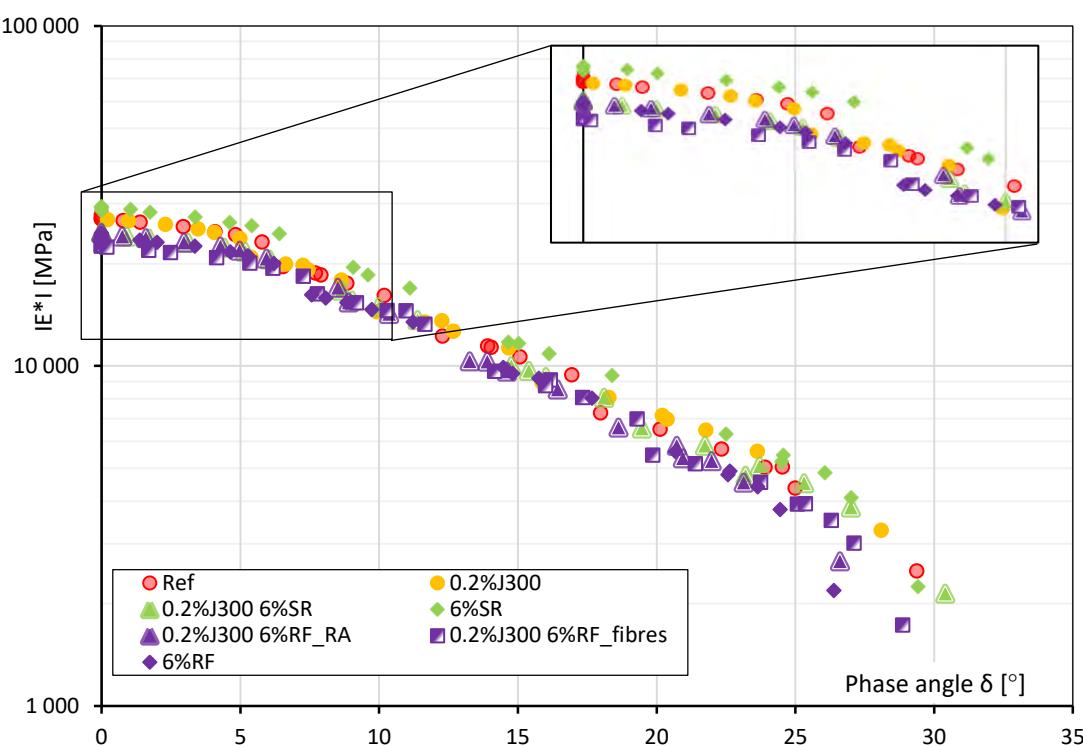

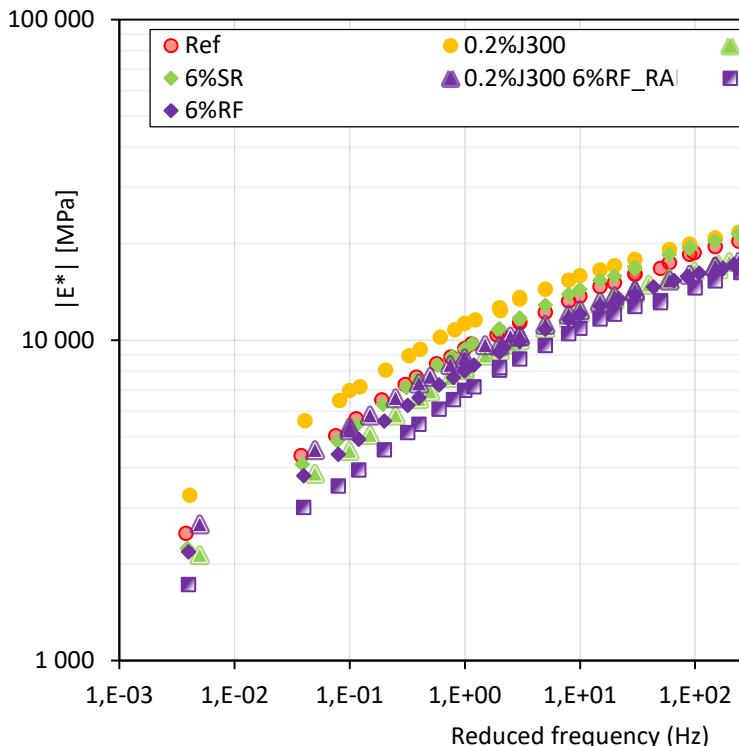

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## ACP 16+ 30% RA – Resistance to crack propagation

# Jute fibres and rejuvenators in bitumen mixture containing reclaimed asphalt

## ACP 16+ 30% RA – Dynamic modulus – 4PB-PR

## Conclusion

- Rejuvenators have positive influence on the compactability
- Lower ITSR in mixtures with jute fibres
- A decrease in the stiffness of mixtures with rejuvenator, an increase of stiffness and decline of thermal susceptibility with jute fibres
- Best crack propagation results: mixture with jute fibres and rejuvenator “SR”
- The addition of rejuvenator and jute fibres showed lower dynamic modulus along the whole range of frequency comparing to the control mixture.
- Desirable behaviour: mixture with jute fibres only, mixture with jute fibres and rejuvenator applied to the RA
- The addition of the rejuvenators with the RA or with the fibres showed a negligible difference in the influence of the different properties, except dynamic stiffness and ageing index. Mixtures with the rejuvenators dosed onto the fibres showed worse ageing results.
